The insurance sector's go-to IT vendor

” *We know how to use
the power of IT
to grow your insurance business.*

Atena. Knowledge and expertise

For over 20 years, Atena has been delivering innovative, end-to-end IT projects for the insurance industry. We develop our own IT solutions and use products from leading global vendors, including SAP and Microsoft. Our innovations soon become industry standards.

Over 60% of Atena's specialists and IT experts combine IT expertise with knowledge of the insurance business. Atena systems are deployed in some of Poland's largest insurance companies. Our IT solutions for sales network collaboration has over 9,000 users.

The insurance industry challenge

Our clients are paying more and more attention to the growing link between insurance sector development and its ability to effectively acquire and process data. It is in this context that an organisation's internal cost and process flexibility becomes crucial.

Insurance companies must face the challenge, which is also a market necessity, of dynamic adaptation to the current economic situation without generating additional costs. This can be achieved by:

- Automated support processes
- Mobile access to information
- Settlements with supervising entities
- Efficient closing of the settlement month
- Effective handling of policy processes
- Rapid launching of new products

- Extended reporting and information-management capabilities
- End-to-end support for customer and agent settlements
- Consistent management of heterogeneous and distributed sales network structures
- Mobile agent support
- End-to-end settlement support for policies and sales networks.

Optimizing internal processes gives the organisation the required flexibility at a low cost.

This can translate into better product pricing, service quality and business relations among all of the participants in the sales process.

Atena. Insurance Platform Non-Life

Our system provides comprehensive support for insurance company business processes to increase efficiency in all areas, from product definitions to policy processing and financial settlements with customers and intermediaries. Advanced technological solutions make it easy to flexibly shape operating models and customize them to business requirements. Atena. IP Non-Life can rapidly map internal organizational changes. Its intuitive user interface can be customized to suit corporate requirements.

Business benefits

Increased efficiency of insurance company operations

End-to-end business process support

Atena.IP Non-Life is a modern, integrated IT solution to support insurance company business processes for personal and property insurance. It ensures uniform process execution, from product modelling and sales network definitions to full policy handling and financial settlements for policies, business partners and agents.

The single, unified IT solution also generates obligatory compliance reports for supervisory bodies. Settlement and collection modules ensure total control over insurance company financials, allowing the company to shape customer service policy for due and overdue payments.

Companies who deploy Atena.IP Non-Life as an end-to-end solution are getting a tool that optimizes business processes and reduces costs.

Atena.**Insurance Platform** Non-Life lowers costs and increases the effectiveness of service processes throughout the insurance company.

Business benefits

Quick and convenient information access

The comprehensive architecture of Atena.**IP** Non-Life allows users to access relevant information from all areas of insurance company operations. The information is collected within a single integrated systems platform.

The flexible reporting module is based on Oracle Application Express (Apex), Oracle's free web application development platform, and provides functionality for defining dedicated reports. This enhances information access and customer service, and streamlines management decisions. An intuitive user interface means that system operators can work faster.

Process automation and rapid execution

Atena.**IP** Non-Life provides system process automation capabilities to ensure standardized information exchange between business areas. The same processes also support users during routine policy handling. With fewer operator errors, work gets done faster. Automation decreases user workloads and increases staff productivity.

Rapid and cost-effective product commercialization for minimum time to market

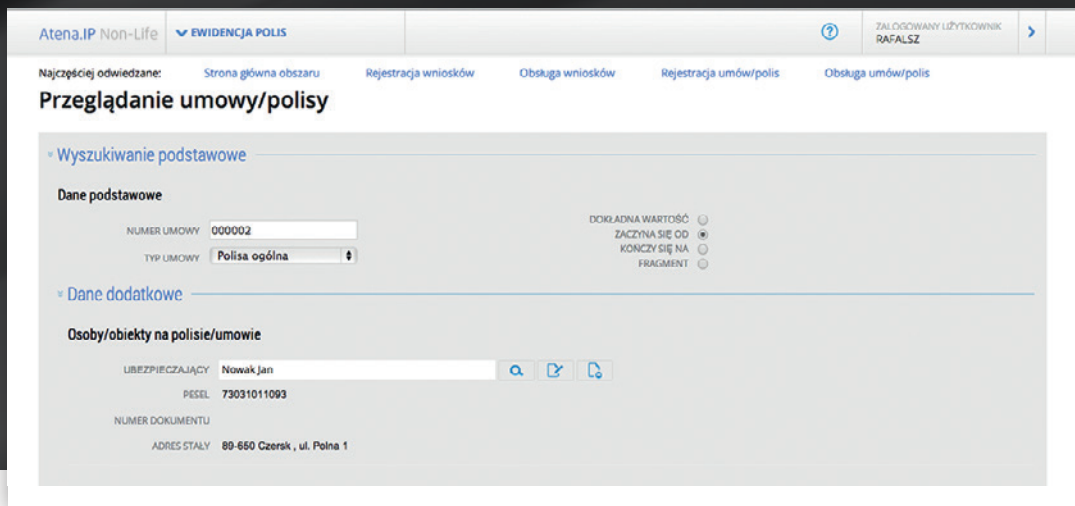

Product portfolio management

Atena.**IP** Non-Life provides the agility to rapidly respond to changing market conditions. System functionality allows product portfolios to be updated efficiently by changing product features, deploying new products or discontinuing unprofitable products. Insurance companies can apply more flexible pricing policies to increase sales and profitability.

Atena.**IP** Non-Life comes with an integrated modeller module and msg.PM product engine to maximize product portfolio modelling performance. This allows changes to product structure definitions (e.g. updates or extensions) and the development of new products. A configurable reporting module makes it easy to efficiently analyse product profitability.

Lower product operation costs

When Atena.IP Non-Life is added to the IT environment as a total solution, product operation costs are significantly reduced. Comprehensive and integrated, the system allows product definitions to be propagated from a central location to reduce change time and cost and ensure consistent product definitions.

Mobile solutions for sales support

Atena.IP Non-Life provides strong support for sales network management, with flexible options for building sales networks and remuneration schemes. It gives companies freedom to define the components of agent remuneration (e.g. as commissions or bonuses) and link them to sales results for maximum motivation.

The mobile solution allows agents to quickly calculate automotive insurance premiums during customer engagements. This improves work comfort and involves the customer in the policy selection process for increased satisfaction.

The mobile solution can also present an agent's portfolio as commission reports and invoices. Flexible product support combined with efficient network management yields increased sales.

Optimize IT infrastructure efficiency

Our comprehensive solution

Atena.IP Non-Life is based on integrated modules to handle business processes in specific areas of insurance company operations. Using this system architecture, complex business scenarios involving various business areas can be executed and handled as a single system process, for instance selling a vehicle or performing agent settlements. The ergonomic interface is based on a common platform to provide operators with a uniform experience across all processes.

Atena.**IP** Non-Life allows insurance companies to execute critical business processes for personal and property insurance in a standardized and efficient way.

Business benefits

Lower system maintenance and change costs

By deploying an end-to-end IT system, technical infrastructure costs are reduced through savings on licensing and disparate hardware. Any changes are less costly to make, as they don't need to be propagated throughout a complex IT environment. This leads to faster deployments and reduces the risk of unsynchronized changes in different business areas.

A single unified business and technology architecture provides the necessary flexibility to adjust to changes in the legal and business environment. Because it uses a service-oriented architecture (SOA), Atena.**IP** Non-Life is highly flexible in its integration with external systems.

Integrated modular structure for reduced data storage costs

Atena.**IP** Non-Life modules correspond to different areas of an insurance company's business. Each one provides dedicated functionality to suit its specific area. Inter-module communication is used to provide data and services to other areas. That way, information from one module is accessible throughout the system. This reduces the risk of data duplication and eliminates the cost of storing redundant information.

Because Atena.**IP** Non-Life is modular, insurance companies can pick and mix modules to upgrade their existing IT systems.

Close partnership

With every single IT project we deliver, we are committed to building close partnerships with our clients. Our team of over 500 staff includes top experts, business analysts and developers. We have the unique ability to look at technology from

the point of view of the end user. We are always striving to get to the root of insurance business processes and transform them by leveraging the full potential of IT.

Extensions and development

Atena.IP Non-Life can be integrated with any solution used by the insurance company, including mobile applications. It can be deployed as a standalone solution to provide total control of all insurance company processes. It is also possible to deploy only selected modules, such as Atena.IP SFC for sales network support and agent settlements.

Modern technologies for rapid deployment and low change costs

Atena.IP Non-Life is built to Java EE specifications. It can be installed on any compatible application server. The entire solution can also be embedded in the cloud. Relational data is stored in an Oracle database.

Atena.IP Non-Life architecture provides comprehensive support for insurance company back office operations. By building a single-platform solution, we can offer applications customized to individual requirements in various business areas while eliminating the need to develop separate mechanisms for data exchange between modules. The system structure guarantees rapid deployment and low change costs.

Functionalities

- Product definition modelling
- Support for sales networks and commission settlements
- Policy registry
- Automatic policy renewal support
- Policy and agent settlements
- Integration with banking and financial/accounting systems
- Person and entity registry
- Calculations for technical reserves and reinsurance amounts
- Collections support for policy and recourse dues
- Document registry
- Document management
- Apex-based reporting module
- User and privilege management module

Business architecture

- Optional and highly independent modules
- Flexible business process mapping
- Extensive integration capabilities, SOA-compliant architecture

Technical architecture

- Atena Insurance Platform is built to Java EE specifications, using:
 - Seam, JSF and RichFaces for user interface components
 - EJB3 and myBatis for business logic and data storage
- The system can be installed on any Java EE-compatible application server, including:
 - JBoss
 - IBM WebSphere (optional)
 - Oracle WebLogic (optional)
- Relational data is stored in the Oracle database.

Atena. Insurance Platform Non-Life

- Fast time to market
- Business process automation
- Rapid access to relevant information
- Product sales support for agents
- Product definition modelling
- Advanced settlements for policies and agents
- Support for statutory reporting obligations
- Efficient end-of-month financial processing
- Seamless integration with external systems
